

# BUILDING A LEAN, MEAN DRUPAL THEME

Presented:

July 23, 2015 at [DrupalGovCon](#)

August 15, 2015 at [Drupal Camp Asheville](#)

# JIM SMITH

- Oak Ridge, Tenn.
- Front-end Drupal Developer at [DSFederal](#)
- Started using Drupal in 2005
- [Drupal user #16880](#)

**GET THE HOME VERSION  
FOR HOURS AND HOURS OF FUN!**

<http://startinggravity.github.io/lean-drupal>

# WHY DO WE CARE ABOUT PERFORMANCE?

- Fast sites make impatient users happier.
- Happy users view more pages.
- Happy users buy more stuff.
- Fast sites are cheaper to host.
- Clean code is easier to maintain.

**HOW MUCH DOES THE AVERAGE WEB PAGE WEIGH?**

# SIZE OF AVERAGE WEB PAGE

(top 1000 websites)

- More than 1600K

source: [WebsiteOptimization.com](http://WebsiteOptimization.com) (July 2014)

# NUMBER OF OBJECTS IN AVERAGE WEB PAGE

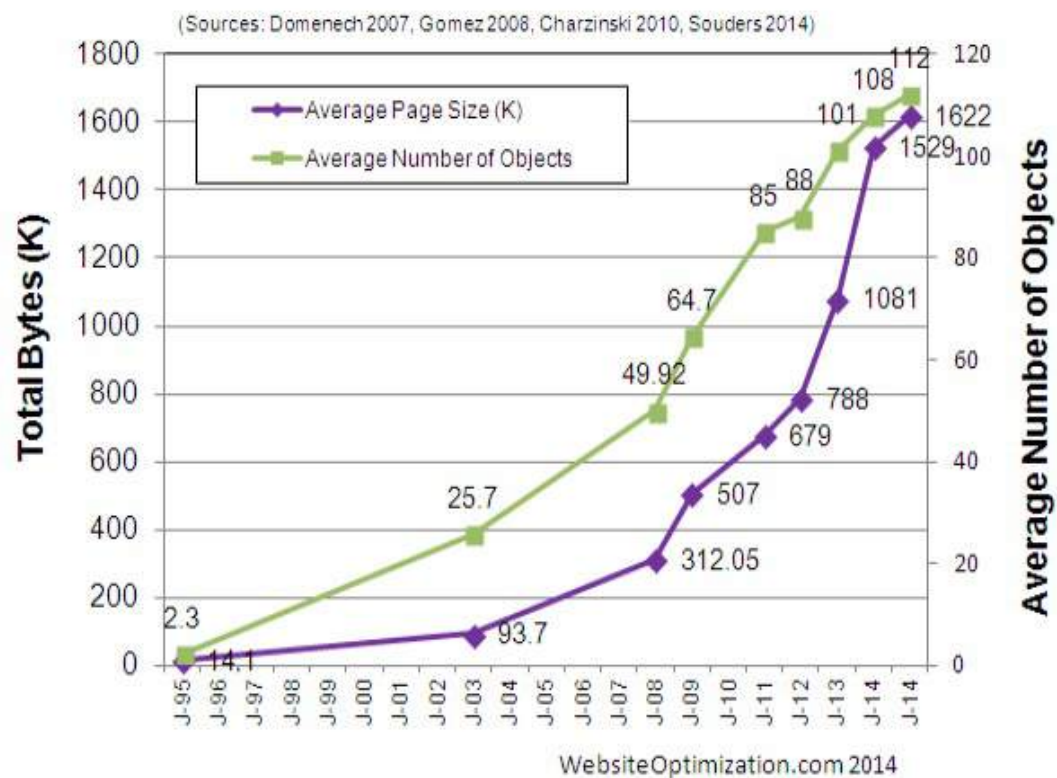

(top 1000 websites)

- About 112 objects

source: [WebsiteOptimization.com](http://WebsiteOptimization.com) (July 2014)

### Growth of Average Web Page Size and Number of Objects - Jan 1995-July 2014

source: [WebsiteOptimization.com](http://WebsiteOptimization.com) (July 2014)

Just because we think we have a lot of bandwidth doesn't mean we must use it.

A screenshot of a tweet from Micah Godbolt (@micahgodbolt). The tweet text reads: "The definition of irony. @verge article about how the mobile web sucks: 4.3mb 271 requests 14/45sec w/ 3g on mobile". The tweet interface includes a profile picture, the name "Micah Godbolt", the handle "@micahgodbolt", a gear icon for settings, and a "Follow" button.

**Micah Godbolt**  
@micahgodbolt

The definition of irony. @verge article about how the mobile web sucks:  
4.3mb  
271 requests  
14/45sec w/ 3g on mobile

source: [Micha Godbolt \(@michagodbolt\)](#) - July 20, 2015

# DELAYING PAGE LOAD TIME BY ONE SECOND

- Conversions drop by 7%
- Page views drop by 11%
- Customer satisfaction drops by 16%

source: [Aberdeen Group](#) (November 2008)

**DON'T BE SLOW.**

A long-exposure photograph taken from the driver's perspective inside a car at night. The image shows the car's dashboard with circular gauges on the left, air vents in the center, and a CD slot. The road ahead is illuminated by light trails from other vehicles, with bright red and yellow streaks indicating fast-moving traffic. The text "HOW DO WE GO FASTER?" is overlaid in a white, bold, sans-serif font on a dark rectangular background in the upper center of the image.

**HOW DO WE GO FASTER?**

**BUT WAIT...**

# ASSUMPTIONS

- Every site will have different requirements, different libraries, different needs.
- The fastest request you will ever make is the one you don't make.

# LIMITS TO CONNECTIONS

Connections per Hostname and Total Connections

Summary Security Rich Text Selectors API <b>Network</b> Acid3 JSKB												
Top Browsers												
name	score	PerfTiming	Connections per Hostname	Max Connections	Script Script	Script Stylesheet	Script Image	Script Iframe	Async Scripts	CSS	CSS + Inline Script	
<input type="checkbox"/> Chrome 32 →	12/16	yes	6	10	yes	yes	yes	no	yes	yes	yes	
<input type="checkbox"/> Firefox 26 →	11/16	yes	6	17	yes	yes	yes	no	yes	no	no	
<input type="checkbox"/> IE 9 →	12/16	yes	6	35	yes	yes	yes	no	no	yes	yes	
<input type="checkbox"/> IE 10 →	12/16	yes	8	17	yes	yes	yes	no	yes	yes	yes	
<input type="checkbox"/> IE 11 →	12/16	yes	13	17	yes	yes	yes	no	yes	yes	yes

# 20% RULE

For a performance change to be noticeable, it must be at least 20% faster than your previous performance.

source: [apmblog.dynatrace.com](http://apmblog.dynatrace.com)

# PERFORMANCE GOLDEN RULE

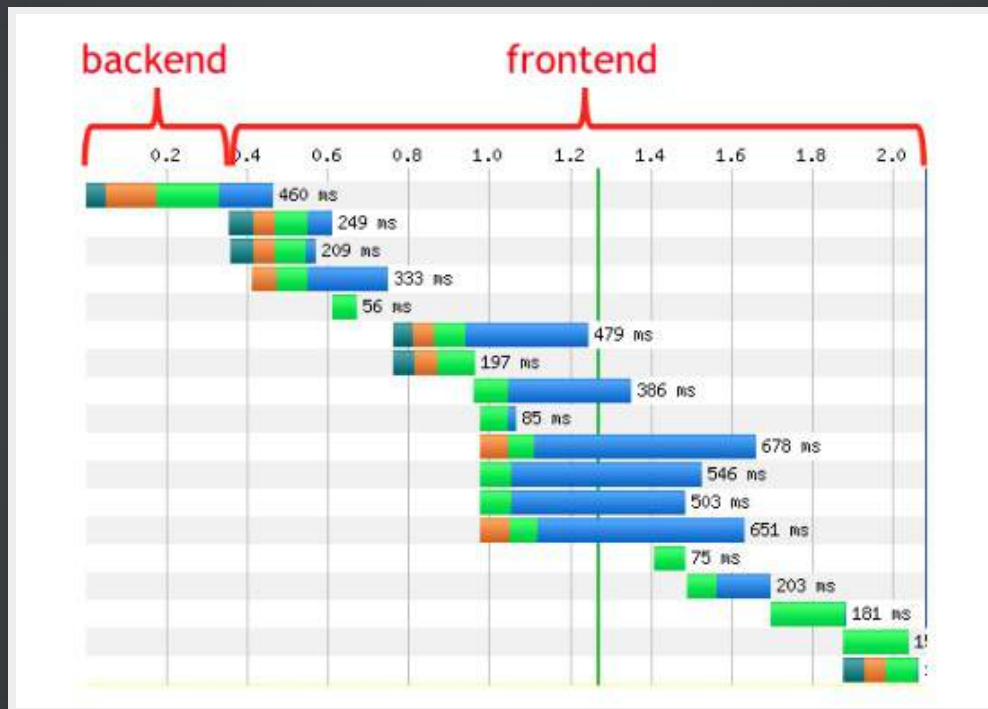

80-90% of the end-user response time  
is spent on the frontend.

Start there.

source: [Steve Souders Blog](#)

# BACKEND VS. FRONTEND

source: [Steve Souders Blog](#)

# BACKEND VS. FRONTEND

- Backend: The time it takes the server to send the first byte to the browser.
- Frontend: Everything else.

source: [Steve Souders Blog](#)

# 6 WAYS TO SPEED UP YOUR SITE

1. Cache everything you can
2. Clean up Drupal's cruft
3. Clean up your code
4. Concatenate and minify your code
5. Deliver assets efficiently
6. Set a performance budget and test against it

A large field of rusted, abandoned cars, symbolizing obsolescence. The cars are scattered across a grassy field, with many showing significant damage and decay. The background features a line of bare trees under a clear sky.

**SOME OF THIS INFORMATION WILL BE  
RENDERED OBSOLETE BY [HTTP/2](#) AND DRUPAL 8!**

# CACHE EVERYTHING YOU CAN

"The first rule of optimization and caching is this: never do something time consuming twice if you can hold onto the results and re-use them."

source: [Jeff Eaton \(Lullabot Blog\)](#)

# CACHE EVERYTHING YOU CAN

- Turn on [page and block caching](#)
- Turn on Views caching, including blocks
- Install [Views Content Cache module](#)
- For smaller sites, install a caching module like [Boost](#)

# CACHE EVERYTHING YOU CAN

- Larger sites should use [Memcache](#) or [Varnish](#) (must be installed on your server)

# CLEAN UP DRUPAL'S CRUFT

"There are a bazillion reasons why Drupal is slow, but the main one is *because you weren't paying attention.*"

source: [Dan Kegel's Web Hostel](#)

# CLEAN UP DRUPAL'S CRUFT

- Don't use core's Update module
- Don't use core's Statistics module
- Use [Fast 404 module](#)
- Turn off, and if possible, remove every unnecessary module
- Don't install a module unless there's no way to avoid it

# CLEAN UP YOUR CODE

```
▼ <div class="center-wrapper">
  ▼ <div class="container">
    ▶ <div class="row">...</div>
    ▼ <div class="row">
      ▼ <div class="grid-wrapper clearfix">
        ▼ <div class="inside">
          ▼ <div class="panel-pane pane-entity-field pane-node-field-grid-items">
            ▼ <div class="pane-content">
              ▼ <div class="field field-name-field-grid-items field-type-entityreference field-label-hidden">
                ▼ <div class="field-items">
                  ▼ <div class="field-item landing-page-recent-instagram even">
                    ▼ <div class="fieldable-panels-pane">
                      ▼ <div class="field field-name-field-instagram-account field-type-drupagram-last-pic field-label-hidden">
                        ▼ <div class="field-items">
                          ▼ <div class="field-item even">
                            ▼ <div class="instagram-media">
                              ▶ <a href="https://instagram.com/xxxxxx" target="_blank">...</a>
                              </div>
                              ▶ <div class="instagram-caption">...</div>
                            </div>
                          </div>
                        </div>
                      </div>
                    </div>
                  </div>
                </div>
              </div>
            </div>
          </div>
        </div>
      </div>
    </div>
  </div>
```

source: [Mario Hernandez \(Mediacurent Blog\)](#)

# CLEAN UP YOUR CODE

- Follow Drupal's [best practices](#) for themes
- Use a base theme that is inherently clean of unnecessary <divs> and classes
- Use custom theme template files to remove unnecessary stuff
- Use [Fences module](#)
- Better yet, create a custom theme without a base theme

# CLEAN UP YOUR CODE

- Use **BEM**, **SMACSS** and/or **OOCSS** to organize your CSS
- Understand **specificity** in your CSS and avoid its traps
- Understand **selector efficiency**

# CONCATENATE AND MINIFY YOUR CODE

"There is a reason jQuery calls the minified version the production version and the original source the development version."

source: [Matt Farina \(The Engineered Web\)](#)

# CONCATENATE AND MINIFY YOUR CODE

- Use core's CSS and JS aggregation
- Use [Advanced CSS/JS Aggregation \(AdvAgg\)](#) module
- Make Modernizr more efficient with [Modernizr module](#)
- Use [Uglifyjs module](#)

# CONCATENATE AND MINIFY YOUR CODE

- Use Gulp and [gulp-uglify](#)
- Use [SVG images](#) when you can, instead of JPG or PNG
- Use software or a service like [Smush-it](#) to compress images
- Use [Gulp-imagemin](#) to compress images used in your theme during development

# DELIVER ASSETS EFFICIENTLY

"There is real empirical evidence that substantiates the fact that speed is more than a feature. It's a requirement."

source: [Fred Wilson "10 Golden Principles of Successful Web Apps"](#)

# DELIVER ASSETS EFFICIENTLY

- Move scripts to the footer with [Magic module](#)
- Make images responsive and efficient with [Picture module](#)
- Distribute assets with [CDN module](#)
- Defer image loading with [Image Lazyloader module](#)
- Use the [Image API Optimize module](#)
- Try a [sandbox module](#) to make speculative requests that prefetch and prerender content your visitor is likely to see next.

# DELIVER ASSETS EFFICIENTLY

- Instead of a module, just [add prefetch links](#) to your theme
- Try [domain sharding](#)
- Add inline CSS and JS that's used "above the fold"
- Use the [Critical node module](#) with Gulp to automate inline CSS and JS
- Use hosted versions of libraries, such as [Google Hosted Libraries](#)

# BUDGET AND TEST

"When I first heard the concept of a performance budget, I groaned quietly, rolled my eyes, and thought, 'Oh, great. One more technical thing to stand in my way.'"

source: [Katie Kovalcin \(Happy Cog Blog\)](#)

# BUDGET AND TEST

- A performance budget is a goal you set for load times on your site.
- Test representative pages of your site. Do this frequently and consistently.
- Also run tests against competitor or similar sites.
- A budget helps you make decisions on what and how things are displayed.

# HOW THE PERFORMANCE BUDGET AFFECTS DEVELOPMENT DECISIONS

- You may be forced to optimize existing content.
- Or remove something no longer important.
- Or leave out a feature that breaks the budget.

# 4 TYPES OF BUDGETS

We can view metrics in four different ways and measure them accordingly.

- Milestone Timings
- SpeedIndex
- Quantity-based metrics
- Rule-based metrics

source: [Tim Kadlec Blog](#)

# MILESTONE TIMINGS BUDGET

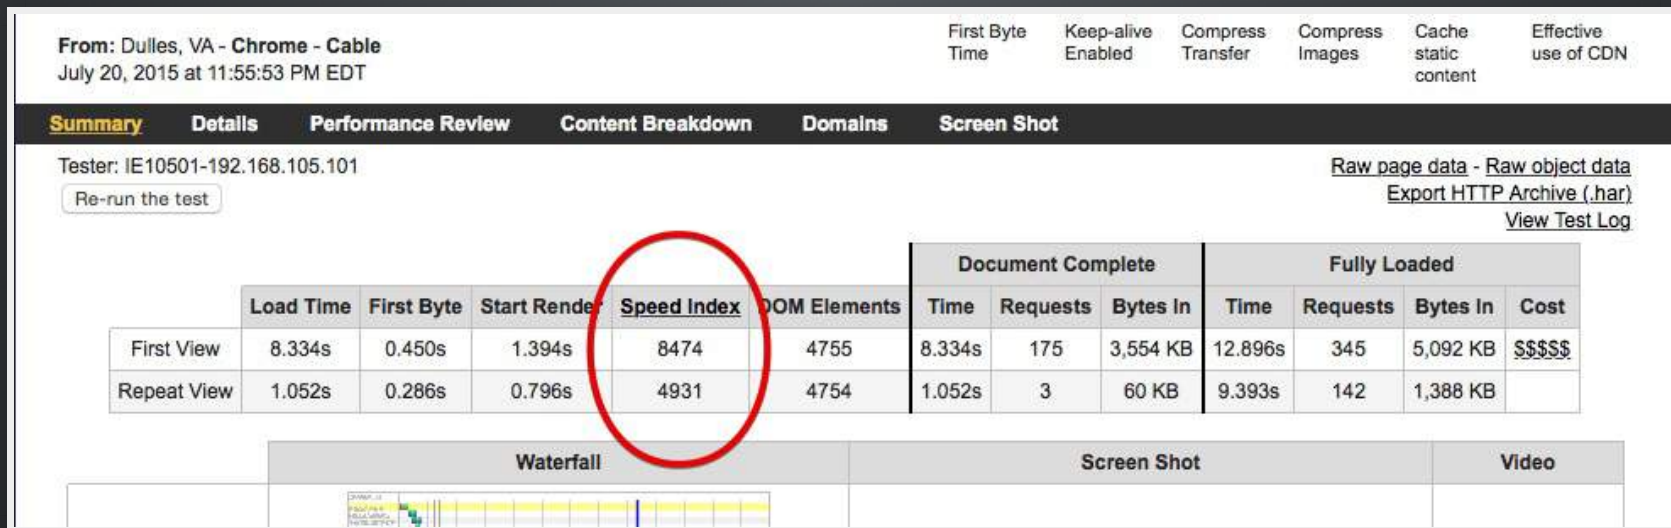

Typically, the time to render a page

- Measures the whole page, not just what the visitor sees
- Useful if you set your own milestone, such as time to expose a form

# SPEEDINDEX

The average time it takes for visible parts of a page to display, expressed in milliseconds and dependent on size of the viewport.

- An effective test because it measures what a user sees
- Best measured with [WebPageTest.org](http://WebPageTest.org)

# QUANTITY-BASED METRICS

A simple counting of all requests issued or the total weight of a page.

- Easy to measure and easy to track during development
- Tells you nothing about user experience

# RULE-BASED METRICS

More a checklist of optimizations you should be doing.

- Can be used as a metric in a budget
- Use [Chrome PageSpeed Insights](#) or [YSlow Scores](#)

PageSpeed Insights 8+1

<http://nytimes.com/> ANALYZE

Mobile Desktop

**61 / 100** Speed

**Should Fix:**  
Avoid landing page redirects  
[Show how to fix](#)

Thank you
